Jesse Austin-Stewart: BEYOND NEARSIGHTEDNESS (2018)
beyond nearsightedness is an octophonic work that functions as a deconstruction of the relationship between space and gesture.

Leah Barclay: MIGRATION PATTERNS: INVISIBLE ECOSYSTEMS (2018)
'Migration Patterns: Invisible Ecosystems' is a 16-minute surround sound live performance (8 channels). All sounds featured in this piece were recorded with hydrophones in Queensland, Australia.
The ocean is often an invisible ecosystem, a complex acoustic environment, where marine life is reliant on sound to communicate and survive. Sound is felt, reflected and absorbed in aquatic ecosystems. It propagates underwater at different speeds and is affected by temperature, pressure and salinity. The impacts of climate change are often very visible in terrestrial environments, yet dramatic changes in marine ecosystems are going unnoticed simply due to visibility. Increased anthropogenic noise and rising temperatures continue to cause unfathomable ecological disruptions that are dramatically transforming the acoustic ecologies of our oceans.
'Migration Patterns: Invisible Ecosystems' in an immersive performance exploring the fragility and complexity of marine life that live in a world of sound and vibration. Drawing on a large database of hydrophone (underwater) recordings from the coastline of Queensland, this work traces sonic migration patterns and shifting ecologies from the smallest micro-crustaceans to the largest marine mammals on the planet. The recordings focus around the Great Barrier Reef, Great Sandy Biosphere Reserve and K'Gari (Fraser Island), a major transitory point for humpback whales on their southern migration. The whale song continues to adapt and evolve in response to changing environments and the recordings are contributing to ongoing scientific research on the value of aquatic acoustic ecology in climate action.
This performance immerses listeners in the depths of marine ecosystems and transposes infrasonic and ultrasonic recordings into perceptible ranges. The soundscapes are layered and sculpted into an immersive sonic environment that navigates the ocean through auditory data and embodied listening.
The creative development of Migration Patterns has been supported by the Queensland Conservatorium Research Centre and Griffith Climate Change Response Program at Griffith University. Additional hydrophone recordings for this project have been provided by Marine Biologist Elisa Girola at JASCO Applied Sciences.

Ryan Burge: RETURNING HOME (2019)
returning home brings together disparate places captured in field recordings from various locations in Perth, Western Australia. Drawing from the contemporary trends of 'hypnagogic pop' and 'hauntology' that exploit nostalgia through appealing to one's memories of the past through the use of cultural artefacts, the piece combines digital synthesis with sounds recorded using a condenser mic, coil mic and hydrophone. Noah Creshevsky (2005) defines hyperreal music as an "electroacoustic musical language constructed from sounds that are found in our shared environment ('realism'), handled in ways that are somehow exaggerated or excessive ('hyper')", whilst Barry Truax (2012) suggests a possible form of soundscape composition that is the creation of a purely imaginary or virtual world, one that arguably aligns with the concept of the 'hyperreal'. Probing the intersection of these definitions by using familiar found sounds, articulate synthetic gestures, the electromagnetic sound of logging into social media and lo-fi production techniques such as noise, crackle and saturation, returning home explores the possibility of hyperreal music.

Nicole Carroll: ORRERY ARCANA (2018)
The Orrery Arcana system includes a self-made modular hardware controller and custom software that allows the performer to manipulate sound during performance. The hardware controller is used to navigate systems that encompass chance operations, conceptual mapping, and data mapping, to control audio generation and processing. These process systems are based on NASA lunar data, the esoteric system in W. B. Yeats' (1865-1939) A Vision" (1937), and the numerology and symbolism of the Tarot. The NASA data and Yeats' system both relate to moon phases. The NASA data is applied directly to synthesis and processing parameters, while Yeats' system and poetic symbolism are used for compositional and structural shape. NASA and Yeats provide the objective and

subjective binaries that operate independently and collaboratively. W. B. Yeats' system is situated in the centre, as it contains elements of both Tarot and lunar mapping. Virtual Tarot cards are drawn" during the performance, and the numerological assignments and symbolism are mapped to processing parameters as well as macro structures.
Sound sources include generated audio, field recordings that represent elemental correspondences, and samples from the composer's other bespoke instruments. The controller features modular control objects in the form of concentric rings that represent a Tarot deck. The major arcana cards control macro parameters and development trajectories, while the minor arcana cards control selected synthesis and processing parameters. The hardware interface is housed on a planetary gear system, which allows the performer control over timing and sequenced events through manual gear rotations. Each gear is equipped with a sensor plate upon which light, magnetic, and capacitive-touch sensors are mounted; these sensors are manipulated via concentric rings of various colours of acrylic and embedded magnets.

John Robert Ferguson and Andrew Brown: AUDIO-VISUAL INTERIORS (2019)
John Robert Ferguson and Andrew - laptops
Audio-Visual Interiors is a quadraphonic audio-visual composition performed by a live electronic duo. The work explores relatively uncharted territories of timbral and rhythmic space, presenting a sonic landscape that is unfamiliar yet strangely reminiscent. Both authors have developed new bespoke instruments for this work, these utilise Pure Data running on portable mobile devices. Brown explores ring modulation synthesis controlled by multi-dimensional touch gestures; this process provides a rich diversity of sonic potential whilst always maintaining remnants of the physical gestures used in performance. Effects and quadraphonic sound distribution enhance and relocate what is otherwise a simple monophonic sound source. Ferguson uses a self-made instrument that features an array of buttons and knobs wired to an iPhone, resulting in a surprisingly well-ordered assemblage that may nevertheless be liable to melt at any moment. Euclidean rhythms and sound-file granulation are at the foreground of Ferguson's sound world but the audio samples chosen very much speak for themselves, beyond the performers attempt to manipulate them. Touch Designer is used for live visuals, with both performers sending MIDI messages from their mobile devices to a laptop running visuals. Quadraphonic sound diffusion is both automated and responsive to tactile input and computational parameters. The work involves performance with live algorithms where performer agency is augmented by machine agency, as all agents exert their influence in somewhat unpredictable ways. The work emerges from the interactions amongst musicians and machines, following a tight compositional structure that still allows for moment-to-moment improvisation and surprise.

Sandra González: PROYECCIONES SONORAS (2018)
Kim Tan – Flute, Sandra González - Laptop
The work was composed in the research program "Temporal Systems and Spatial Synthesis in Sound Art". To compose the part of the bass flute, the Pitch Class Sets and Combinatorial Matrices were used through the External Object Library PCSlib (Pablo Di Liscia - Pablo Cetta) for Pure Data (Miller Puckette). The investigation of the relationship between the spatiality of sound and the methods of synthesis and transformation of the same was approached from the analytical approach proposed by Gary Kendall. The electronic sounds work the game with the perceptive grouping. Multichannel reverberation is used as a processing technique to create artistic content. We consider the location of the flautist, to work the "Interplay" between the perceptive grouping as a function of spatiality. They also take into account their study of containment as an auditory scheme. The implicative theory specified by Stéphane Roy is developed in the work through disturbing movements that cause disruption.

Barry Hill: THE SOUND OF A SUNRISE... (2019)
This work is a is an automated data sonification and video recording captured at a specific geographic location, time and date (Sunrise January 1st 2019). The recording seeks to be a representation of the environmental energy exchange between human technology and the natural environment using data remotely hacked from a wi-fi data server designed to monitor the performance of a prototype mobile

solar power generator. The stereo soundscape is created using music and data networking software (Raspian Code, MAX 4 Live, Ableton) that continuously measures the amount of sunlight striking the photovoltaic solar panels of the power generator. The system creates a musical 'composition' that is autonomously controlled and manipulated by the patterns of sunlight present in the immediate environment at the time of the recording. The soundscape comprises four distinct melodic voices that represent or sonify energy consumption, production as well as battery storage voltage and capacity data. The audio work is experienced as a polyphonic linear melody that moves through a chromatic chord progression. A synchronised video image accompanies the soundscape that allows the audience to experience the changing visual imagery of the environment during the data sonification recording. The video image is captured from Woodford Folk Festival Hilltop stage looking south east toward the sunrise the across the Sunshine Coast Hinterland. Creative themes imbedded within the work include data sonification, acoustic ecology , computer engineering as art and the age of the anthropocene. The work is inspired by broad themes of environmental awareness, Maddrell's (2010) "polyvocal landscapes" and Turrell's "Sky space" visual art installations.

Fiona Hill: IMAGO (2018)
Dominique Chaseling – Flute, Judith Dodson – Soprano, Fiona Hill - Laptop
"She went hysterical when I was taken away and it took two people to hold her down." "I used to look into prams. I was convinced that I was going to find her." "As for my birth father, I don't know anything other than his name." These are just some of the harrowing quotes from transcripts compiled on the History of Adoption website by Monash University:
http://artsonline.monash.edu.au/historyofadoption/
Forced Adoption, one of the recent tragedies of Australian history, forms the foundation of the work 'Imago': for flute, voice and electronics (also able to be performed as solo flute and electronics). The piece responds to the multi-faceted stories of those affected by Forced Adoption as well as societal attitudes and the eventual governmental apology to victims. The work layers text derived from victim transcripts, interviews and governmental hearings with live, processed flute and voice and music concrete derived from domestic soundscapes. The work is able to be performed in stereo or quadrophonic configurations. It is controlled by a standalone Max MSP application or via a MaxMSP patch. The piece was created with funding from the APRA AMCOS Art Music award and it's premiere was at Tilde~ New Music Festival, Melbourne, Australia on 19th January 2019 with Lamorna Nightingale on flute and Jane Sheldon soprano. Further funding for a recording of the work alongside other current Australian electroacoustic flute pieces has been provided by the Australia Council for the Arts. In addition an educational kit aimed at secondary high school students has been funded by the NSW Department of Education. Through extramusical inspiration Fiona ties together often disparate genres and sound worlds in an electroacoustic and spatialised context. Through the use of technology she experiments in blurring the boundaries between performer and computer attempting to create seamless integration of components and ensure maximum freedom for performers.

David Hirst: THE PORTUGUESE SUITE (8 Channel Version) (2018)
The Portuguese Suite follows on from the piece Imaginação de Viseu (Imaginations of Viseu) which was composed for the project: SONIC EXPLORATIONS OF A RURAL ARCHIVE - Electroacoustic Music and Sound Art International Competition, coordinated by Binaural/Nodar (Portugal). That work used sound sources recorded in the rural region of Viseu Dão Lafões in Portugal. The Portuguese Suite takes some of the sounds from the previous piece and processes them into purely abstract sounds using two suites of tools I developed in 2017 for Max/MSP. The first suite of tools is called NES-Tools, and processes sound in the time domain. The second suite of tools, NES-Spectrale, processes the frequency domain representation, and builds on the work of Jean-François Charles (2011). This version has been especially mixed and mastered for 8 channels using the Ambisonics Toolkit (ATK) from the University of Washington.

Donna Hewitt: PERMAFROST (2019)
Alana Blackburn – recorders, Donna Hewitt - laptop
The work is composed specifically for Blackburn and is the first composer-performer collaboration between these two artists. It is inspired by Alana's comprehensive musical vocabulary with the

recorder family and highlights her extensive performance experience with the instruments. The work utilises both natural and synthesised sounds, including some recordings of Antarctic wildlife. The work aims to entwine the textures, timbres and spatial characters of the live and pre-recorded sounds. The work is inspired by the concept of 'Permafrost', the 'permanently' frozen earth found in colder climates. The predicted thawing of the permafrost is accompanied by some ominous scientific predictions for the future of our climate, ecosystems and health and was at the forefront of Hewitt's mind as she composed this work.

Pei-Fen Huang: IN THE NAME OF LOVE (2018)
Dominique Chaseling – Flute, Pei-Fen Huang - Laptop
This piece of music attempts to make a live flute playing, and a pre-recorded electronic sound, similar but different mutual restraint and counterbalance. Described by music: the emotional entanglement between the two generations with blood relationship; when the protection of the previous generation for the protection, teaching and love envisioned by the next generation, fermentation becomes excessive intervention, limiting the development of the next generation, The generation is obedient to unbearable pressure, and then resists the conflicts that arise.
The flute represents in the music is a life individual that seems to be protected, but is actually not respected, restricted everywhere, and unable to maintain freedom. The original sound material of electronic music comes from the pre-recorded flute and midrange flute, representing a number of carers (elders) from the same blood relationship. In the interaction between flute and electronic music, it can be found that the flute is often restrained by electronic music and conflicts. Although in the music, the flute is very eager to break away from such restraint, and has tried to get rid of the restriction to make a monologue (solo part), Under a lot of pressure, in the end, the flute was gradually engulfed in the sound of a noisy electronic music. The music in the music is spoken in Taiwanese words, "Tia Way, Gon Lee Boon Tan, Wee Lee Ho", etc. These keywords represent the Taiwanese experience of the Japanese rule. The era, the influence of the legacy of military culture, and the national government in education, instilling traditional Chinese Confucianism, and the values of various social concepts, the father's generation to the next generation, claims to be from the language, the language traits.

Stuart James: PARTICLE IV (2019)
Building on a series of works exploring a synergy of live acoustic feedback and spectral spatialisation, often involving the processing of a live instrument, this work builds on two new developments by the composer: the determining of multi-point spatial texture based on the multi-point spatial distributions of frequency spectra and auditory effects across the soundfield, and secondly, an application of video matrix data as a structure for determining frequency distributions across space facilitated via audio-rate controlled ambisonic equivalent panning. The work is a study designed to demonstrate the variety of spatial distributions possible using a variety of sound sources derived from found objects and field recordings. The performance will involve the live diffusion of these sound sources using an interface that allows for controlling the choreography of multi-point spatial distributions, and how these are animated and behave. This work will be adapted for the Meyer Constellation array at Monash University utilising Manifold-Interface Amplitude Panning (MIAP) with Meyers SpaceMap software and the MIAP objects for MaxMSP.

Stefanie Petrik, Kylie Supski and Roger Alsop: LECTURE ON NOTHING (2019)
Stefanie Petrik, Kylie Supski and Roger Alsop - performers
John Cage's original "Lecture on Nothing" focused on music's experiential effects on consciousness expansion. Our adaptation uses spatial sound design & visual projections to disorientate the listener in a unique participatory installation. Moving through the installation's space builds a unique linear narrative. This movement forces the listener to interact with the experiential intimations that John Cage was exploring in 1950. Its 8-channel sound design makes use of memory and independent free-associations. Visual projections including elements of performance and collage techniques also present Cage's original text with a modern visual interpretation.

Julian Scordato: CONSTELLATIONS (2014)

"Constellations" is a composition for IanniX graphical sequencer and electronics. It was created between March and April 2014. The world premiere occurred on October 1, 2014 at the CCRMA (Center for Computer Research in Music and Acoustics) of the Stanford University, in the contest of their annual Transitions concert series. Further performances and screenings took place within numerous international festivals and exhibitions.

Based on the reading of a IanniX score constituted by 356 punctual events and two drones for controlling additive synthesis parameters and bandwidth-limited noise respectively, this work assumes a certain complexity through the interaction between elementary electronic sounds in a feedback network capable of processing them synchronically and diachronically. Thus, sonic elements no longer exist just as intrinsic and independent entities; they become instead strongly characterized by global processes that transform them as part of the network.

Michael Spicer: A FIRESIDE TALE (2019)
Over the past few years, I have been regularly using abstract digital images as graphic musical notation for acoustic and electronic performances. In this context, I'm particularly interested in how the pattern recognition features of our brain can construct narratives from the abstract images and how they that can inform the musical interpretation. This piece is centred on a video score that I created by a combining a sequence of digital images and then processing them in video patcher that I made with vizzie, in MaxMSP. This particular interpretation of the score was made by assembling several recordings of modular analogue and digital synth performances. Whilst working with the score, a vague narrative based on an imaginary "history of the universe" story somehow emerged from the sequence of images. This narrative is reflected in the instrument design and performance decisions.

Cissi Tsang: CORRIDOR (2019)
Corridor is a piece exploring the use of a single sound source to construct a soundscape - as though the sound is mediating on itself. This piece is also about movement, loss and attempting to preserve what was left. The original field recording was made in an underpass in Neerabup National Park, in the northern suburbs of Perth, Western Australia. Neerabup is an important stretch of bush for two main reasons - firstly, it acts as a wildlife corridor for native wildlife (particularly the many native birds) and secondly it incorporates and protects part of an ancient Aboriginal migration route, which is now a walking trail called the Yaberoo Budjara Heritage Trail. The piece was then constructed by overlaying multiple versions of the original recording together, using a mixture of time stretching (by 800%, 400%, 600% and 200%), effects (delay, resonators, doppler) and panning. The resultant composition was then turned into an audio visualisation using Trapcode Sound Keys and Trapcode Form, in Adobe After Effects.

Lindsay Vickery: QAALUP 2019
Lindsay Vickery – bass clarinet
qaalup derives pitch, rhythmic and formal structure from a field recording made in the Fitzgerald River National Park, on the Western Australian coast between Bremer Bay and Hopetoun. The region is the largest single national park in the south-west of Western Australia and a UNESCO designated biosphere – one of only 10 in Australia and the only one in the state. It is estimated to support 12 threatened fauna and 39 threatened flora species, and contains about 20 per cent of WA's described plant species, many of which are found nowhere else in the world. Quaalup, a homestead built in 1858 is the only property in the park. A field recording was pitch-shifted down by two octaves and then audio outside "ecological niches" (frequency bands with greater activity) at 1231, 505, 115, and 68Hz, was threshed out to create multiple channels of sound. Strangely this process resulted in the creation of a "found object" bass-line (something like Robert Ashley's Automatic Writing (1979)). A temporally proportional score was built from data in the spectrograms of each channel. The score is performed from iPad using the Decibel Scoreplayer with 5 additional iPads used to generate synchronised audio diffused through Bluetooth speakers.

Alex White and Ian Stevenson: MESO-MODULUS, FOR MODULAR SYNTHESISER AND DIGITAL SPATIALIZATION (2019)

This 12 minute creative performance work for modular synthesiser and digital spatialisation explores the compositional affordances of the modular synthesiser in the context of live semi-improvised performance. The proposed performance relates to a long paper submission to ACMA 2019 Analog Algorithms: Generative Composition in Modular Synthesis and would function as a demonstration of the concepts explored relating to generative compositional processes specific to modular synthesisers. The work plays with the tension between fluid gestural morphologies and meso-scale forms of sonic repetition and pattern formation. Temporal form is developed through self-quotation enabled by the storage and recall capacities of the spatialisation system. A distanced-based algorithmic panning system creates both immersion and a sense of soloist and ensemble structure.
